

Marvel® features comparison: Sentry System™ and MicroSentry™

Next-generation technology protects your investment

Marvel's exclusive temperature monitoring systems provide features that keep foods, wine and beverages at just the right temperatures for optimum flavor and storage life.

- The **Sentry System™** refrigeration monitor safeguards the *Chateau Collection* of ultra premium wine cellars and beverage refrigerators, available in 15-, 24- and 30-inch widths and selected *Outdoor Series* and refrigerated drawer models to preserve the very pinnacle of luxury living, both inside and outdoors.
- The **MicroSentry™** refrigeration monitor system maintains constant and precise temperatures for all models in Marvel's *Luxury Series* line of popularly priced wine cellars and beverage refrigerators, as well as for undercounter refrigerators in 15 and 24 inches.

Shared features offer optimal preservation

The Sentry System and MicroSentry temperature monitors are digitally optimized, temperature-control systems that deliver specific storage and serving conditions for individual needs. Whether they're protecting food, wine or beverages, the systems share several features necessary to accomplish the task:

- **Temperature set point adjustment:** The starting point, which allows the user to choose the precise desired temperature to ensure food or drinks are properly preserved and cooled
- **Contents temperature display:** Unlike many products that display the set point temperature only, these systems display the actual, real-time temperature of the food, wine and beverages for more precise storage, more refreshing beverages and fresher food. This feature is especially important for wines, since temperature fluctuations during storage can adversely affect wine's flavor
- **Essence of luxury:** For an unobtrusive presence, the LED display is discreetly hidden by the door frame
- **Display lighting:** Glass door models use this feature to showcase the unit's contents—a nice touch for ambient room lighting and elegant wine display
- **Door ajar alarm:** A potentially crucial feature, the door ajar alarm sounds when the door is inadvertently left open—a key protective measure to prevent food from spoiling; a light or display alerts the user to the specific reason for the alarm sounding
- **High/Low temperature alarm:** Another necessary function, especially for proper wine storage; unlike most products, Sentry System and MicroSentry monitors have visible and audible alarms

Making the best, better

For the ultimate in food, wine and beverage storage quality and duration, Marvel's Sentry System adds more features:

- **Power failure alarm:** When the system detects a loss of power to the unit, an amber LED light flashes until the alarm is reset, allowing the user to take necessary precautions to temporarily keep any beverages at a more proper temperature. Recovery from any alarm-inducing events is easy: Simply press the "ON/OFF" button for approximately one second to reset all audible and display alarms.
- **Sabbath mode:** This user-activated feature puts the unit in blackout mode during the Sabbath period and automatically resets to display mode after up to 72 hours; for user convenience, the unit also can be manually reset
- **Fahrenheit or Celsius display:** As an added convenience, Sentry System allows the user to toggle the temperature display between the two temperature measurements
